

Project Design Phase
Proposed Solution Template

Date	03 October 2026
Team ID	SWTID-2026-9943
Project Name	Implement Client Script and UI Policy (Incident)
Maximum Marks	2 Marks

Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	On the ServiceNow Incident form, agents and users can save incomplete or inconsistent data (for example, missing close notes on a resolved incident, irrelevant fields shown, no warning for critical priority). Errors are found only after saving, causing rework, delayed resolution and poor reporting.
2.	Idea / Solution description	Implement UI Policies and Client Scripts on the Incident table. UI Policies make fields mandatory, read-only or visible based on State, Category and Priority without code. Client Scripts (onLoad, onChange, onSubmit) set defaults, show messages when Priority = 1, auto-fill related fields and validate the Short description before the record is submitted.
3.	Novelty / Uniqueness	Combines the no-code UI Policy approach with scripted Client Scripts in one reusable design, so validation happens instantly in the browser with no page reload or server round trip. Rules apply consistently on the Native UI, Service Portal and mobile, and can call a Script Include (GlideAjax) for dynamic checks.
4.	Social Impact / Customer Satisfaction	Reduces agent frustration and data-entry errors, speeds up incident resolution, and gives end users faster, more accurate support. Cleaner data improves SLA tracking, reporting and audits, increasing satisfaction for both customers and the service desk.
5.	Business Model (Revenue Model)	Internal ITSM value: lower rework and handling time per incident. Can also be offered as a ServiceNow configuration service, packaged as an update set with a fixed implementation fee plus optional support or training subscription.
6.	Scalability of the Solution	Moves between instances (dev, test, prod) through update sets or scoped apps. The same pattern extends to Problem, Change and Request forms, supports more fields and roles, and is maintained centrally with no extra infrastructure.
